

Virtual Science for Kids

Objective: *How does one combine computer skills with the natural sciences? How do biologists, chemists, and physicists use modeling and computational analysis to solve real-world problems? How can computer models be applied to medicine, environmental studies, and systems engineering? These are all pressing questions that every modern scientist must answer*, and this course is aimed to give kids a glimpse of the many ways in which computation and modeling can be applied to almost every arena of science.

Course format: 20 minute mini-lecture + 55 minute activity

Session	Topic	Objectives
1	Biochemistry The Twirly World of Proteins 	<ul style="list-style-type: none"> Students understand the molecular basis for protein folding and function Students are able to find and analyze protein structures from the Protein Data Bank Students identify different classes and functional classifications of proteins
2	Systems Biology Agent-Based Modeling for Population Analysis 	<ul style="list-style-type: none"> Students used agent-based modeling to monitor population systems Students are able to understand the use of mathematical population modeling on understanding complex biological systems Students are introduced into NetLogo scripting
3	Medicinal Chemistry Engineering a Cure with Molecular Medicines 	<ul style="list-style-type: none"> Students are introduced into the role of small molecule therapeutics in modern medicine Students gain skills in submitting docking jobs to an external server Students work on an individual project describing the putative biological activity of a small molecule drug candidate

4	<p>Physics & Engineering Your Own SpaceX - The Physics Behind Rockets</p> 	<ul style="list-style-type: none"> Students gain background in thrust, lift, and projectile motion Students gain an understanding of the mathematical basis behind physical parameters.
5	<p>Environmental Science Saving the Day in Smog City</p> 	<ul style="list-style-type: none"> Students are introduced to systems engineering models that describe multivariate dependencies Students gain an appreciation for the application of modeling in environmental studies
6	<p>Genetics <i>BLASTing the Genetic Code</i></p> 	<ul style="list-style-type: none"> Students gain experience using large genetic databases to probe biological systems Students are introduced into introductory bioinformatics and sequence alignment Students use BLAST to understand genetic similarity between species.
7	<p>Electrical Engineering Circuit Circus</p> 	<ul style="list-style-type: none"> Students gain hands-on experience in building circuits and understanding the relationship between voltage, resistance, and current in electrical systems Students understand the utility of predictive modeling in electrical systems.
8	<p>Anatomy & Physiology <i>Digital Surgeon - Virtual Frog Dissection</i></p> 	<ul style="list-style-type: none"> Students are introduced into the world of digital dissections, and the bioethical motivation behind such programs Students gain an in-depth understanding of vertebrate anatomy and physiology, including a survey of most internal organ systems.
